What an unlucky timing! I came across what would SEF (Search Engin Friendly) URLs do in Joomla after few days of Google bot spider visit. I noticed that it gives my site only one index in Google which is the front page while all other content is ignored, oops...the links (URLs) in my site are not Search Enging Friendly! currently they are but after WHAT!!! hoping for Google spider to visit soon :)

Why would I care about all this crap? well, to think about it, I would say working on my small website with strong bases that would show results after a long period is a good strategy. Page ranking is the most important part for a website because most of your visitors would come from search engines and having your website up-fron in the index takes a while, so I'm starting from now and let it grow as the website grows.
